

AI generated document summary:

Comparative Analysis

Article Title: INTELIGÊNCIA ARTIFICIAL GENERATIVA E AVALIAÇÃO EDUCACIONAL: UMA ANÁLISE DOCUMENTAL

- **Core Problem:** To investigate what Brazilian and international public documents, published between 2022 and 2025, propose regarding the use of Generative AI in educational assessment, and how these guidelines might specifically impact assessment in the context of language teaching.
- **Methodology:** The study employs a qualitative, bibliographic, and documentary research approach. The authors utilized content analysis, following Bardin's three-phase method (Pre-analysis, Exploration of material, and Treatment/interpretation of results), to systematically select and analyze 16 relevant public documents from national and international sources.
- **Key Findings:** The research found that official guidelines advocate for a shift towards formative assessments that leverage AI for designing tasks to evaluate skills, competencies, and performance. The documents emphasize the need for a critical and ethical approach to AI in education, focusing on academic integrity, the teacher's role as a mediator, and fostering human creativity. A central conclusion is the urgent need to promote AI literacy and redesign assessments to be process-oriented, using AI as a supportive tool rather than the sole basis for evaluation.
- **Relevance to GenAI in Education:** This article provides a structured analysis of official and public guidelines on the integration of Generative AI into educational assessment. It synthesizes the current regulatory and pedagogical thinking, highlighting the consensus on moving away from traditional evaluation methods towards more dynamic, formative, and skills-focused approaches, thereby directly contributing to the discourse on policy and practice for AI in education.

Detailed Summaries

Article Title: INTELIGÊNCIA ARTIFICIAL GENERATIVA E AVALIAÇÃO EDUCACIONAL: UMA ANÁLISE DOCUMENTAL

This article presents a qualitative documentary analysis of 16 Brazilian and international public documents published between 2022 and 2025, exploring guidelines for the use of Generative Artificial Intelligence (GenAI) in educational assessment. The primary research questions aim to understand the recommendations within these documents regarding evaluation and their potential impact on language teaching.

The study begins by contextualizing the accelerated integration of AI in education, particularly after the COVID-19 pandemic. It acknowledges the dual nature of GenAI, which offers significant benefits for learning, such as personalization and creative stimulation, while also posing risks like student dependency, ethical concerns regarding authorship, and the perpetuation of cultural biases present in training data. The authors argue that the ease with which AI generates sophisticated content disrupts traditional assessment models, necessitating a fundamental rethinking of what should be learned and how it should be evaluated.

The methodology is explicitly defined as a qualitative, bibliographic, and documentary analysis. The researchers selected documents using keywords and systematically analyzed their contents for themes related to educational assessment. This process revealed that while many documents discuss AI in education broadly, only a subset provides specific guidance on assessment practices.

The core findings indicate a strong consensus among the analyzed documents for adopting formative assessment approaches. The recommendations point towards using AI to design complex tasks that evaluate students' skills, competencies, and performance rather than rote knowledge. A recurring theme is the critical importance of AI literacy for both educators and students to ensure ethical and conscious use of these technologies. The analysis highlights the need to maintain the teacher's role as a mediator and to focus on uniquely human skills like critical thinking, creativity, and ethical decision-making. Although the documents did not offer specific guidelines for language teaching assessment, the authors conclude that the general principles of formative, process-based evaluation are directly applicable.

In conclusion, the paper emphasizes that the discourse on GenAI in education has shifted from outright rejection to a more nuanced exploration of its potential. The analyzed documents collectively call for a paradigm shift in assessment practices, moving towards a continuous, process-oriented model that leverages AI as a tool to enhance learning without becoming solely reliant on it. The study underscores the urgency of developing clear institutional and governmental policies to guide this integration, ensuring that assessments remain fair, equitable, and focused on fostering the complex competencies required in the contemporary world.
